

# Metagenomics and antibiotic resistance

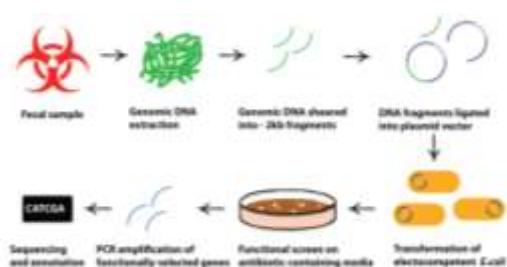

Etienne Ruppé  
Genomic Research Laboratory  
Hôpitaux Universitaires de Genève

# Different types of « metagenomics »

16S rDNA sequencing: diversity, OTUs identification, but not for addressing antibiotic resistance

Shotgun metagenomics: reconstruction of genes through the assembly process, identification of ARDs by sequence homology with known ARDs

Functional metagenomics:  
identification of ARDs with no  
assumption on their sequence

# Identifying ARDs in complex environments by shotgun metagenomics is complex

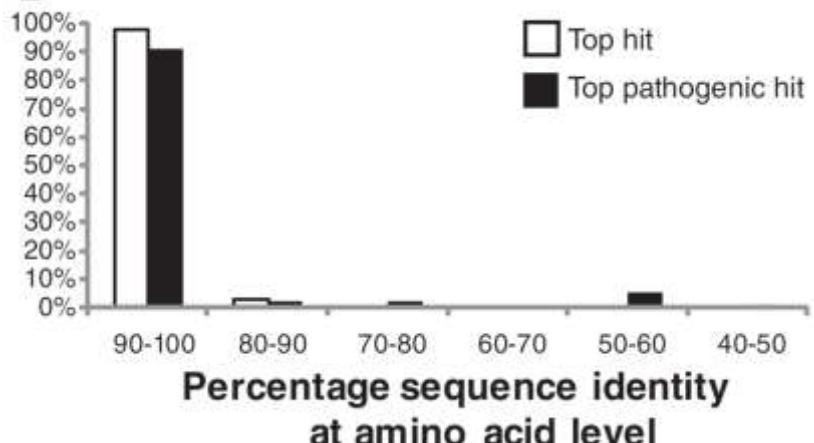

Example of the intestinal microbiota: only ARDs close to known ARDs are found, not those from anaerobic bacteria.

# Functional metagenomics enables the discovery of new ARDs

**B**

Cultivable → ARD databases

**B**

Non-cultivable → under the radar

# Inference genotype-phenotype

Genomics refer to the analysis of organisms at the genome level.

NGS+bio-informatics now enable a « simple » analysis of genomes (including the plasmids and other mobile genetic elements): « whole genome sequencing »
